Agentic Coding Assessment

> **Choose one option**
>
> You may complete **either** Option A or Option B. Both are assessed on how you work with AI coding agents: how you frame problems, make decisions, direct the agent, and judge its output.

Option A: RAG Generator

Problem Statement

Build a **RAG Generator** that:

- Accepts documents at runtime
- Creates a RAG application over those documents
- Allows users to ask questions and receive grounded answers
- Works with different document sets without code changes

You may choose the architecture, stack, models, tools and approach.

Submission

1. Git repo of the working code
2. Complete AI agent transcripts, for example in Codex or Claude Code, use `/export` to get the transcript

Option B: Your Best Coding Session

What to Submit

Share the transcript of the AI-assisted coding session you're most proud of. It can come from a personal project, open-source work, or professional work, as long as you're allowed to share it.

Submission

Share everything through a single GitHub repository, and send us the link. The repo should contain:

1. The complete, unedited AI agent transcript (for example, use `/export` in Codex or Claude Code)
2. A short README (a few sentences) explaining what you were building and why you picked this session
3. The code from the session, if you're able to share it (optional)

Please don't include confidential code, credentials, or proprietary information. Redact anything sensitive and mention in your README what you redacted.
